Key Setting Note:

In bright natural light, the A7IV's 33-megapixel sensor rewards careful composition. The extra resolution over 24-megapixel bodies means you can crop into a portrait without losing texture, which is valuable when the subject is backlit and you want to tighten the frame around the face while keeping the warm rim light intact. Enable Zebra Display set to 100+ to warn you before highlights clip to pure white; the A7IV's dynamic range can recover highlights, but you want to avoid losing texture in the brightest areas of the subject's skin.

Inner Signal Note:

"Bright light reveals everything — every texture, every shadow, every detail. The A7IV will capture it all. Your job is to decide what matters and what should fall away. The resolution is a gift, but only if you use it with intention. The light is abundant, but it will not choose the frame for you."
