Key Setting Note:

The R50 lacks IBIS, so you are relying entirely on lens stabilization and your own handholding technique. The RF 50mm f/1.8 STM has no IS—treat 1/125s as your absolute floor; brace against a wall or use a small travel tripod if the light demands slower speeds. Set Subject to Detect to People and Eye Detection to Auto; the camera's Eye Detection AF remains reliable even in dim conditions, though acquisition may be slightly slower. Under tungsten or warm LED bulbs, switch White Balance to Tungsten for a neutral starting point, or use Kelvin Custom around 3200-3500K if the preset feels too cool. Accept that ISO 6400 will show grain on an APS-C sensor—a grainy, sharp portrait is infinitely better than a clean, blurry one where the shutter speed was too slow.

Inner Signal Note:

"The R50 has no IBIS. It has no full-frame sensor. It has no weather sealing. It also has Canon's color science and an AF system that sees in the dark. Use a fast lens. Hold it steady. Trust the eye detection. The limitations are real. The capability is also real. Low-light portraits on the R50 are a discipline, not a compromise."
