Key Setting Note:

The Sony A6700's compact size is a social advantage at indoor events—guests are less intimidated by a small camera, and you can move through crowds without the "official photographer" barrier. The AI-powered autofocus inherited from the A7R V includes Human Pose Estimation, which recognizes body position and predicts where the face will be, even when the subject turns away. Set Subject Detection to Human, Face/Eye Priority in AF to On. The camera will track faces tenaciously through the event. Enable Silent Shooting for ceremonies where a mechanical shutter would be intrusive; the A6700's electronic shutter is fast enough for most event work without rolling shutter distortion. Under tungsten or warm LED bulbs, Auto White Balance generally produces acceptable skin tones—for more neutral results, switch to Kelvin Custom around 3200–3800K. The 11fps mechanical burst is sufficient for most event work.

Inner Signal Note:

"The A6700 disappears in your hands. That is its superpower. At an indoor event, people forget you're photographing them. The AI will track the eyes. The IBIS will steady the frame. But the real tool isn't the technology—it's the space it creates for you. When you stop checking the focus and start watching the room, the camera becomes invisible. The machine handles the tracking. You handle the presence."
