Key Setting Note:

The Sony A6700's AI-powered autofocus, inherited from the A7R V, is its greatest strength in low-light events. Human Pose Estimation recognizes body position and predicts where the face will be, even when the subject turns away or is partially obscured. Set Subject Detection to Human, Face/Eye Priority in AF to On. For focus, use Zone AF with the zone placed over the primary subject area for more reliable tracking than Wide/Tracking, which can hunt in crowded events. Enable Silent Shooting for ceremonies where a mechanical shutter would be intrusive; the A6700's electronic shutter is fast enough for most low-light event work without rolling shutter distortion. Under tungsten or warm LED bulbs, Auto White Balance generally produces acceptable skin tones—for more neutral results, switch to Kelvin Custom around 3200–3800K. The A6700's IBIS is a genuine advantage, but it doesn't freeze subject movement—keep shutter speed high enough to capture natural gestures. The 11fps mechanical burst increases the odds of a sharp frame in low-light motion.

Inner Signal Note:

"The A6700 is small. The AI inside it is not. The camera will see faces in near darkness, track eyes through crowds, and deliver sharp frames at ISO 6400. But it will not manage your breathing, settle your hands, or steady your composure. The stillness before the shutter is yours. The machine handles the focus. You handle the presence. The grain will be visible. Accept it. The moment matters more than the noise."
