Key Setting Note:

The Sony A6700 inherits Sony's AI-powered autofocus system from the flagship A7R V, including Human Pose Estimation — the camera recognizes body position and predicts where the face will be, even in low light when contrast is low. For low-light portraits, set Subject Detection to Human, Face/Eye Priority in AF to On. The AI tracking will maintain focus on the subject's head even when Eye-AF temporarily loses the eye. The A6700's IBIS is a genuine advantage, allowing you to handhold at slower shutter speeds (down to 1/60s with a steady hand) without introducing camera shake. Use this to your advantage in dim rooms, but keep the shutter high enough to freeze subtle subject movement. Under tungsten or warm LED bulbs, Auto White Balance generally produces acceptable skin tones, though it may lean slightly warm. For more neutral results, switch to Kelvin Custom around 3200–3800K. The A6700's compact size and fully articulating screen make it ideal for low-light portrait sessions — it feels unintimidating, and subjects relax more quickly.

Inner Signal Note:

"The A6700 is small. The AI inside it is not. The IBIS will steady the frame. The AI will track the face. But the real tool isn't the technology—it's the space it creates for you. When you stop checking the focus and start connecting with the person in front of you, the camera disappears. The subject forgets it exists. That is when the real portrait happens. The grain will be visible. Accept it. The moment matters more than the noise."
