Key Setting Note:

The crop factor solution requires the Sigma 10-18mm f/2.8 DC DN (15-27mm equivalent) or Sony E 10-20mm f/4 G PZ (15-30mm equivalent with power zoom for video). Arrive with the correct wide lens—there is no post-processing fix for a room that couldn't fit in the frame. Set shutter speed to BULB, connect a remote release, and walk through the space painting light into shadow areas with an off-camera LED panel while the shutter stays open. At base ISO 100 on a stable tripod, the A6700's sensor produces clean architectural detail that competes with full-frame bodies in long exposures. For rooms even 10mm cannot capture, enable Sweep Panorama mode (Scene > Sweep Panorama) and pan slowly—the camera stitches a wide image in-camera even in dim conditions. Set Kelvin Custom around 3200-3800K for mixed tungsten/LED lighting rather than relying on Auto White Balance.

- Inner Signal Note:

"Base ISO eliminates the ceiling. The tripod eliminates the shake. The wide angle eliminates the crop factor limitation. The light painting eliminates the darkness. Every limitation was specified away before the shutter opened. This is operator precision applied to real estate. The room reveals itself."
