Key Setting Note:

The Sony A6700 is not a professional sports body. Its 11fps mechanical burst is adequate for most indoor sports, but the buffer fills quickly when shooting RAW. For indoor artificial light sports, shoot JPEG (Fine) or Compressed RAW to extend the buffer. The AI-powered autofocus inherited from the A7R V is the camera's greatest strength—Human Pose Estimation recognizes body position and predicts where the athlete will move next, maintaining focus even when the subject turns away or is partially obscured. Set Subject Detection to Human, Face/Eye Priority in AF to On, and AF Track Sens to 2 (Responsive) for sports where athletes change speed or direction frequently. Use Zone AF with the zone placed over the primary action area for more reliable tracking than Wide/Tracking, which can hunt in fast-paced sports. The IBIS is largely irrelevant at 1/500s or faster—camera shake is frozen along with subject motion. Under tungsten or warm LED lighting, Auto White Balance generally produces acceptable skin tones; for more neutral results, switch to Kelvin Custom around 3800–4200K. Enable Silent Shooting for gymnasium sports where a mechanical shutter would be distracting; the A6700's electronic shutter is fast enough for most indoor sports without rolling shutter distortion.

Inner Signal Note:

"The A6700 is small. The AI inside it is not. The machine will track the athlete, predict the movement, and deliver the frame—but it will not anticipate the play. The decisive moment belongs to the photographer who is ready, not the one who sprays. The buffer will fill. The grain will be visible. Accept these things. The moment—the leap, the dive, the finish—is worth the compromise. The machine handles the tracking. You handle the timing."
