Key Setting Note:

Golden hour is where the Sony A7IV's 33-megapixel sensor and colour science produce portraits with a three-dimensional quality that feels closer to medium format than full-frame. The warm, directional light flatters skin tones and creates natural rim light that separates the subject from the background. Use the Daylight white balance preset to preserve the golden warmth; avoid Auto, which may try to neutralise the very light you are chasing. For backlit golden hour portraits, use Spot Metering linked to the focus point to expose for the subject's face — the bright golden background will bloom into a warm, glowing wash without underexposing the skin. Enable Zebra Display set to 100+ to protect the rim light from clipping into pure white.

Inner Signal Note:

"The golden light is temporary. The A7IV will capture it with fidelity, but it will not chase it for you. The warmth will not return once it fades. The operator who moves with intention, who positions the subject before the light shifts, who trusts the eye detection and stops checking the screen — that operator will return with the frame, not just the memory of it."
